## Deprecated

NOTE - The SBMonitor is now deprecated, deferring it's functionality to the SBGui in Monitor Mode. Will have documentation for this soon.

## Overview

The SmartBody Monitor (SBMonitor) can connect to any actively running [SmartBody](#) process in order to easily interact with and debug it.

## Users

### Connecting to SmartBody

1. Go to File -> Open (or hit Ctrl + C)
2. Wait 2 seconds for the dialog to appear
3. Select the desired [SmartBody](#) process to connect to and click the "Connect" button

### Resource Viewer

Used for viewing all the resources that [SmartBody](#) is currently loaded, including .sk's, skm's, characters, services, events, face definitions, sequence and python files, paths, etc.

### Data Viewer

Using a line graph to track channel values of a specific character's skeleton over time

### Command Window

Facilitates the issuing of python, sequence, and [VHMsg](#) commands to [SmartBody](#)

Python Command format

```
<return value type> <python command>
int scene.getNumCharacters()
Possible return types: int, float, bool, string, int-array, float-array, string-array
```

### Face Viewer

Allows the viewing and real-time manipulation of all AU's and visemes that are loaded for the selected character.

### Utils Tab

Provides an easy to use interface for commonly used [SmartBody](#) functionality such as playing animations, setting postures, sending bml, gazing at targets, and text to speech commands.

### BML Creator

Easily allows the creation of simple to complex BML commands through GUI buttons and sliders.

## Developers

### Creating a Dialog

1. Run [https://svn.ict.usc.edu/svn\\_vh/trunk/lib/qt/bin/designer.exe](https://svn.ict.usc.edu/svn_vh/trunk/lib/qt/bin/designer.exe)
2. Create a new dialog and save it in [SmartBody/sbm-debugger/gui/designer](#)
3. Open `sbm-debugger\gui\SbmDebuggerGui.sn`. Create a new class that publicly derives from `QDialog` and have the header include `"ui_YourDialogName.h"`. If you compile, you will have compiler errors
4. Open a command prompt to [SmartBody/sbm-debugger/gui](#)
5. Enter the following commands\*\*
  - a. `qmake -project`
  - b. `qmake`
  - c. `nmake`
6. Edit [SmartBody/sbm-debugger/gui/moc.bat](#) by adding the following line
  - a. `%MOC% YourClassNameThatYouJustCreated.h -o moc_YourDialogName.cpp`
7. Run [SmartBody/sbm-debugger/gui/moc.bat](#)
8. Copy `moc_YourDialogName.cpp` from the `Debug` folder into [SmartBody/sbm-debugger/gui](#)
9. Add `moc_YourDialogName.cpp` and `ui_YourDialogName.cpp` to the `vcproj` under the `Generated` folder

\*\*You need to set the following environment variable for this to work

For using visual studios 2008

- QMAKESPEC      win32-msvc2008

For 2010

- QMAKESPEC      win32-msvc2010

## Message API

Sends

- sbmdebugger

Receives

- sbmdebugger
